

Global Multilingual Live Chat Support Agent

A production-grade AI support system that answers in customers' own language, grounded in real company knowledge, with seamless human escalation.

THE PROBLEM

Global customers. One language of support.

Businesses now sell to customers in every country and language — but support is still built for **one language**, staffed for **one timezone**, and grounded in nothing but a model's guesses. Every customer who can't get help walks away, silently.

76%

of shoppers prefer buying in their own language

40%

will never buy from a site not offered in theirs

24/7

is the support window customers now expect

“

A customer in Karachi types, in Roman Urdu, *“mera order kahan hai?”* at 2AM. The FAQ is in English. Support logs on at 9AM. By then, the sale — and the trust — is already gone.

OUR SOLUTION

One AI agent. Every language. Zero lost sales.

🔥 Every customer you can't answer in their language is a sale walking to a competitor who can.

✅ **Zero language barrier** — replies instantly in the customer's own language

📖 **Zero hallucination** — answers grounded only in the business's real knowledge

📈 **Zero missed revenue** — resolves orders & FAQs before the customer gives up

🙋 **Zero overwhelmed team** — only genuine cases reach a human, as a ticket

✦ A production-grade multi-agent system — not a chatbot demo — that businesses can embed **today** and start converting the customers they're currently losing.

FEATURES & TECH STACK

Everything a real support system needs

-  **Multilingual** — replies in the customer's own language
-  **Native handoffs** — SDK routes Triage → RAG, Action, Escalation
-  **Grounded RAG** — answers only from real company knowledge
-  **Identity check** — unlocks protected data after verification
-  **3-layer guardrails** — safety enforced in backend code
-  **One-script embed** — sandboxed iframe drops into any site

⚙ Built with

• Next.js

• TypeScript

• FastAPI

• WebSocket

• OpenAI Agents SDK

• Google Gemini

• PostgreSQL

• Redis

• Qdrant

• Docker

• GitHub Actions CI

HOW IT WORKS

From message to safe reply, end to end

● Detect & route ● Answer from knowledge ● Verified actions ● Human handoff ● Safety enforced in code

WHY US & WHO IT'S FOR

Not another chatbot wrapper

Structural routing — the SDK hands off natively — not prompt-hacked if/else

Security in backend code — verification & authorization run before any tool executes

Deployable today — migrations, CI, guardrails & tenant isolation, not a notebook demo

FUTURE ROADMAP

What we'd build next

⚡ NEXT UP

WhatsApp & voice channels

meet customers where they already are, beyond web chat

Human agent dashboard — a live ticket queue for the support team

OTP verification — replaces the email-match MVP flow for identity checks

Multi-tenant billing — self-serve onboarding for new client businesses

Let's make support borderless.

Every customer deserves an answer in their own language. Now every business can give them one.
